

Regional Water District — Water Supply and Drought Assessment

Prepared by Water Resources Division

Supply Conditions

Reservoir storage across the district ended the water year at 78 percent of capacity. Water quality sampling met all federal and state standards at 99.7 percent of monitoring points. Per-capita residential consumption fell to 82 gallons per day, driven by turf replacement rebates. Per-capita residential consumption fell to 82 gallons per day, driven by turf replacement rebates. Water quality sampling met all federal and state standards at 99.7 percent of monitoring points.

Water quality sampling met all federal and state standards at 99.7 percent of monitoring points. The treatment plant expansion added 40 million gallons per day of capacity with membrane filtration. The treatment plant expansion added 40 million gallons per day of capacity with membrane filtration. Drought contingency triggers were not activated this year, though long-range forecasts remain uncertain. The treatment plant expansion added 40 million gallons per day of capacity with membrane filtration.

Per-capita residential consumption fell to 82 gallons per day, driven by turf replacement rebates. Lead service line replacement reached 2,300 households, ahead of the consent decree schedule. Per-capita residential consumption fell to 82 gallons per day, driven by turf replacement rebates. Water quality sampling met all federal and state standards at 99.7 percent of monitoring points. Lead service line replacement reached 2,300 households, ahead of the consent decree schedule.

Demand Management

Reservoir storage across the district ended the water year at 78 percent of capacity. Water quality sampling met all federal and state standards at 99.7 percent of monitoring points. Reservoir storage across the district ended the water year at 78 percent of capacity. The treatment plant expansion added 40 million gallons per day of capacity with membrane filtration. Lead service line replacement reached 2,300 households, ahead of the consent decree schedule.

Drought contingency triggers were not activated this year, though long-range forecasts remain uncertain. Drought contingency triggers were not activated this year, though long-range forecasts remain uncertain. Reservoir storage across the district ended the water year at 78 percent of capacity. Reservoir storage across the district ended the water year at 78 percent of capacity. Drought contingency triggers were not activated this year, though long-range forecasts remain uncertain.

Drought contingency triggers were not activated this year, though long-range forecasts remain uncertain. The treatment plant expansion added 40 million gallons per day of capacity with membrane filtration. Drought contingency triggers were not activated this year, though long-range forecasts remain uncertain. Per-capita residential consumption fell to 82 gallons per day, driven by turf replacement rebates. Drought contingency triggers were not activated this year, though long-range forecasts remain uncertain.

Infrastructure

Water quality sampling met all federal and state standards at 99.7 percent of monitoring points. Lead service line replacement reached 2,300 households, ahead of the consent decree schedule. The

treatment plant expansion added 40 million gallons per day of capacity with membrane filtration. Drought contingency triggers were not activated this year, though long-range forecasts remain uncertain. Lead service line replacement reached 2,300 households, ahead of the consent decree schedule.

Drought contingency triggers were not activated this year, though long-range forecasts remain uncertain.
