

A Practical Guide to Sourdough Bread at Home

Prepared by Elena Vasquez

The Starter

A dutch oven traps steam during the first phase of the bake, improving oven spring. Refrigerated retardation overnight deepens flavor and makes scoring easier. Bulk fermentation is complete when the dough has risen roughly fifty percent and holds an indentation. Bulk fermentation is complete when the dough has risen roughly fifty percent and holds an indentation. High-extraction flour ferments faster than white flour and needs less starter.

Bake covered at 250 degrees Celsius for twenty minutes, then uncovered for twenty more. Autolyse the flour and water for one hour before incorporating salt and starter. A dutch oven traps steam during the first phase of the bake, improving oven spring. A mature starter should double within six hours of feeding at room temperature. A mature starter should double within six hours of feeding at room temperature.
